## **ABSTRACT**

In a country like India where cricket is not just a game but a religion, what else can give the action hungry fans a more delicious treat than a super-fast game of the domestic cricket league, IPL? The popularity of the game attracts a lot of revenue as advertising in a IPL match is seen by companies as a great investment made to penetrate the vast Indian market. With so much on stake, it is very important for the teams to focus on their games, strategies and their weakness and strengths as well as for organizing bodies like BCCI for the peaceful conduct of matches and tournaments adding to the brand value of the game. Therefore, it is very important to store and maintain the related data mentioned above.

This project aims to design a database system that keeps track of the status of players, their respective teams and their performances, coaching staff, supervision, and the tournaments being conducted their venues and media coverage, etc. A statistics company like “Stato-Inferno” chips in to provide these services.

## ***Problem statement***

In a country like India where cricket is not just a game but a religion, what else can give the action hungry fans a more delicious treat than a super-fast game of the domestic cricket league, IPL? The popularity of the game attracts a lot of revenue as advertising in a IPL match is seen by companies as a great investment made to penetrate the vast Indian market. With so much on stake, it is very important for the teams to focus on their games, strategies and their weakness and strengths as well as for organising bodies like BCCI for the peaceful conduct of matches and tournaments adding to the brand value of the game. Therefore, it is very important to store and maintain the related data mentioned above.

This project aims to design a database system that keeps track of the status of players, their respective teams and their performances, coaching staff, supervision, and the tournaments being conducted their venues and media coverage, etc. A statistics company like “Stato-Inferno” chips in to provide these services.

The requirements are:

All the players are grouped into three categories (entities) -

1. Batsmen
2. Bowlers
3. All-rounders

Each player has a personal profile encompassing information about their name, age and matches played . Important statistics have been covered with attributes like -

1. For Batsmen: Batting average, strike rate, centuries, total runs, innings played, etc. for the batsmen.
2. For Bowlers: Bowling average, strike rate, 5 wicket hauls, total wickets taken, matches played, etc. for bowlers
3. For all-rounders: a combination of the above-mentioned attributes.

All the teams will include a combination of the above three categories of players with some people in the role of

1. Captain,
2. Vice-captain
3. Wicket-keeper

The different venues and the stadiums are also included in the database along with the capacity of the stadium.

The details of the injury recovery staff which include a physiotherapist is also included, The coaching staff along with their field of expertise(bowling, fielding etc) is mentioned in the database. The user can access and collect data about the required information whenever he/she wants.

## ACTORS

People who interact with the database are:

- ❖ Media
- ❖ Public
- ❖ Boards
- ❖ Players

Some sample queries

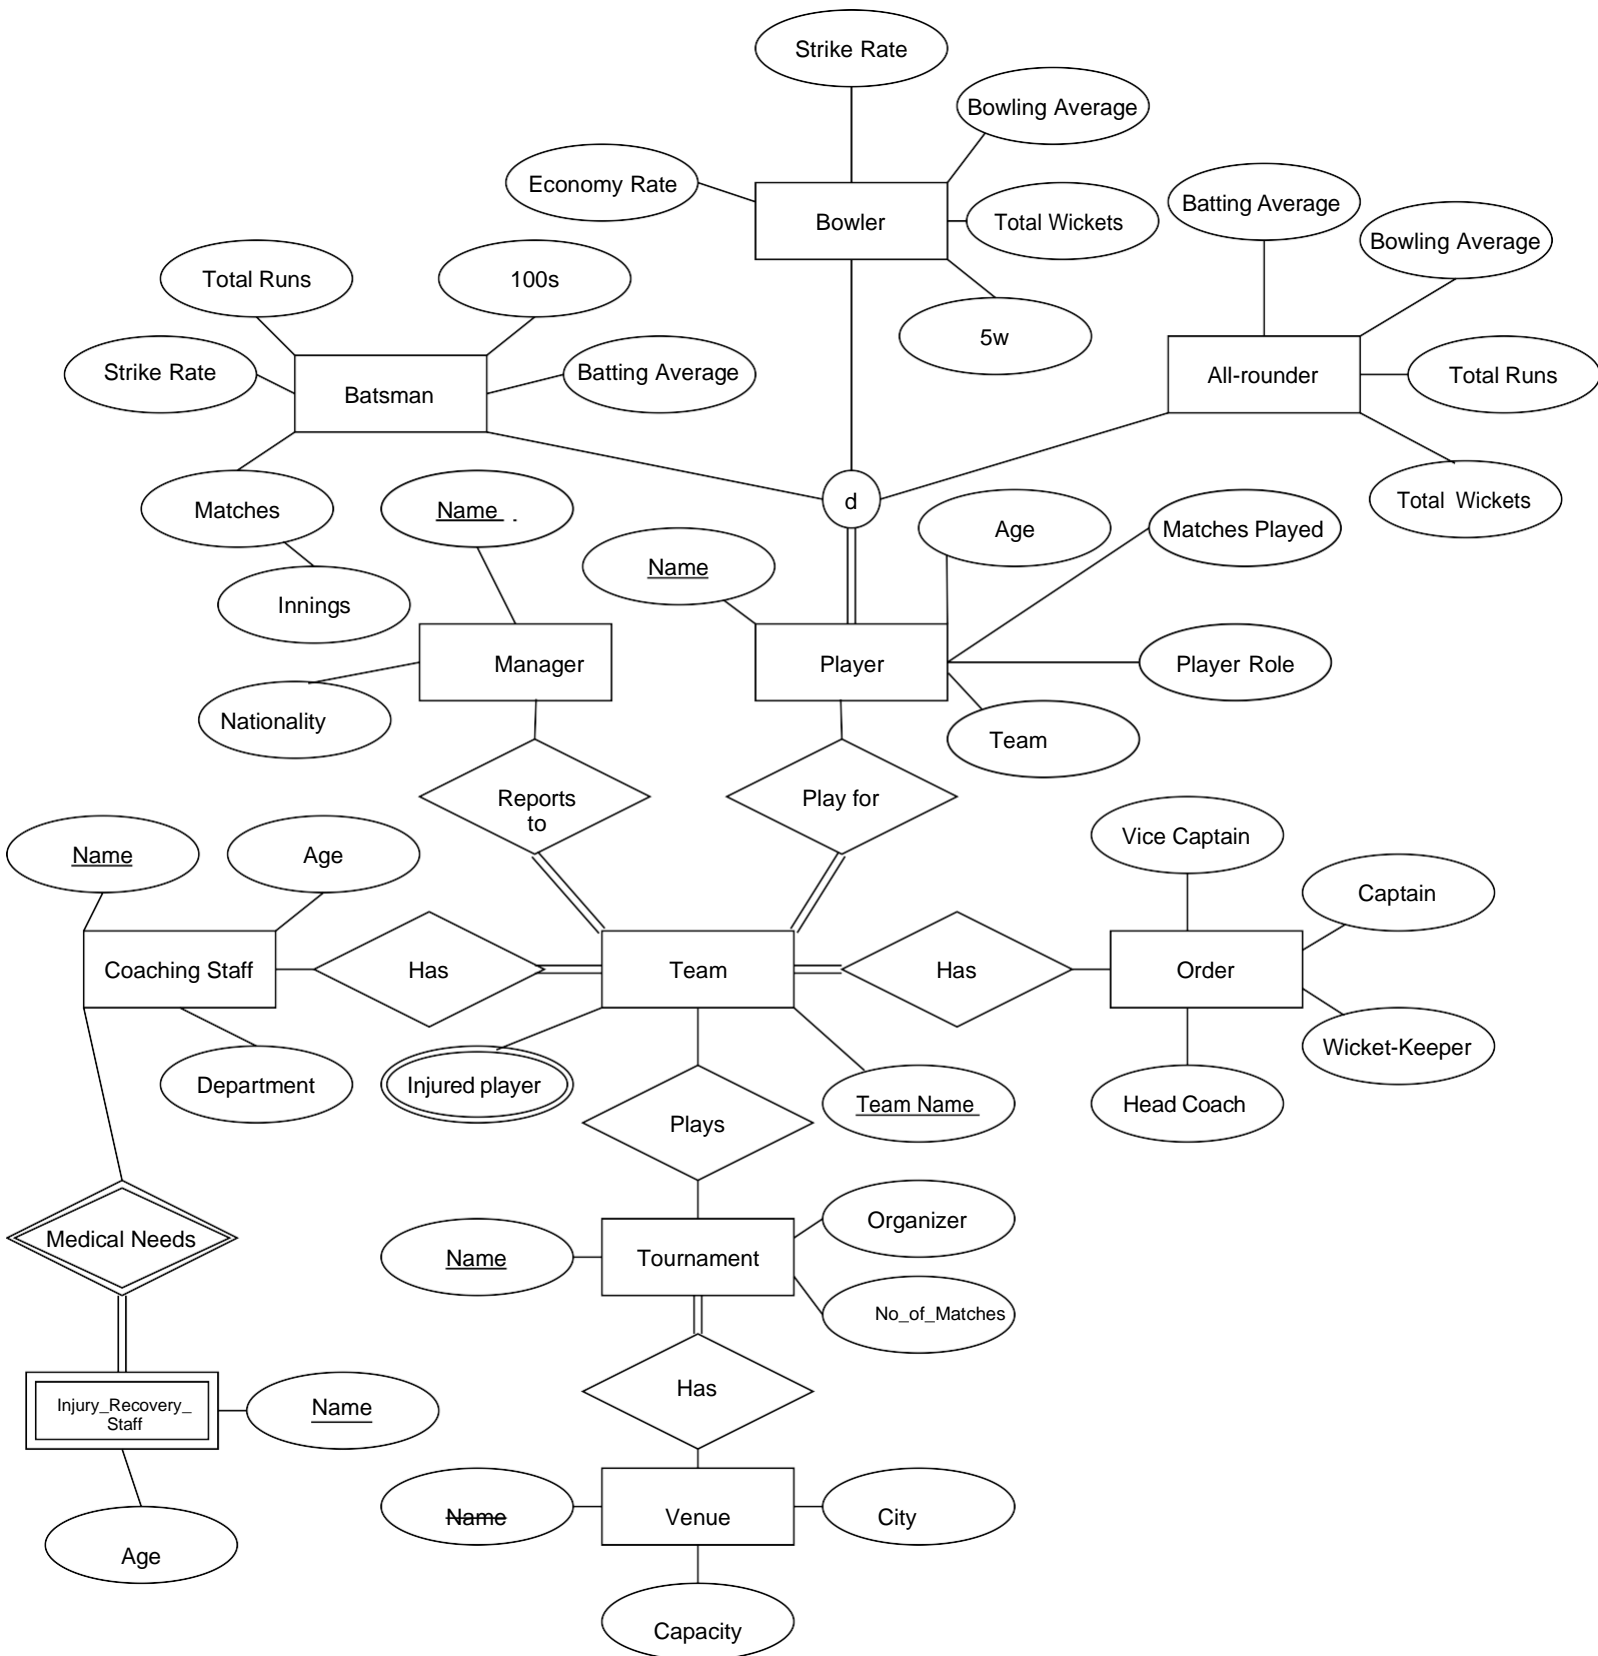

Media and Public can:

- See list of teams selected.
- Check players in a team.
- Obtain statistics of all players.
- Obtain the list of tournaments.
- Get the list of venues of a tournament.

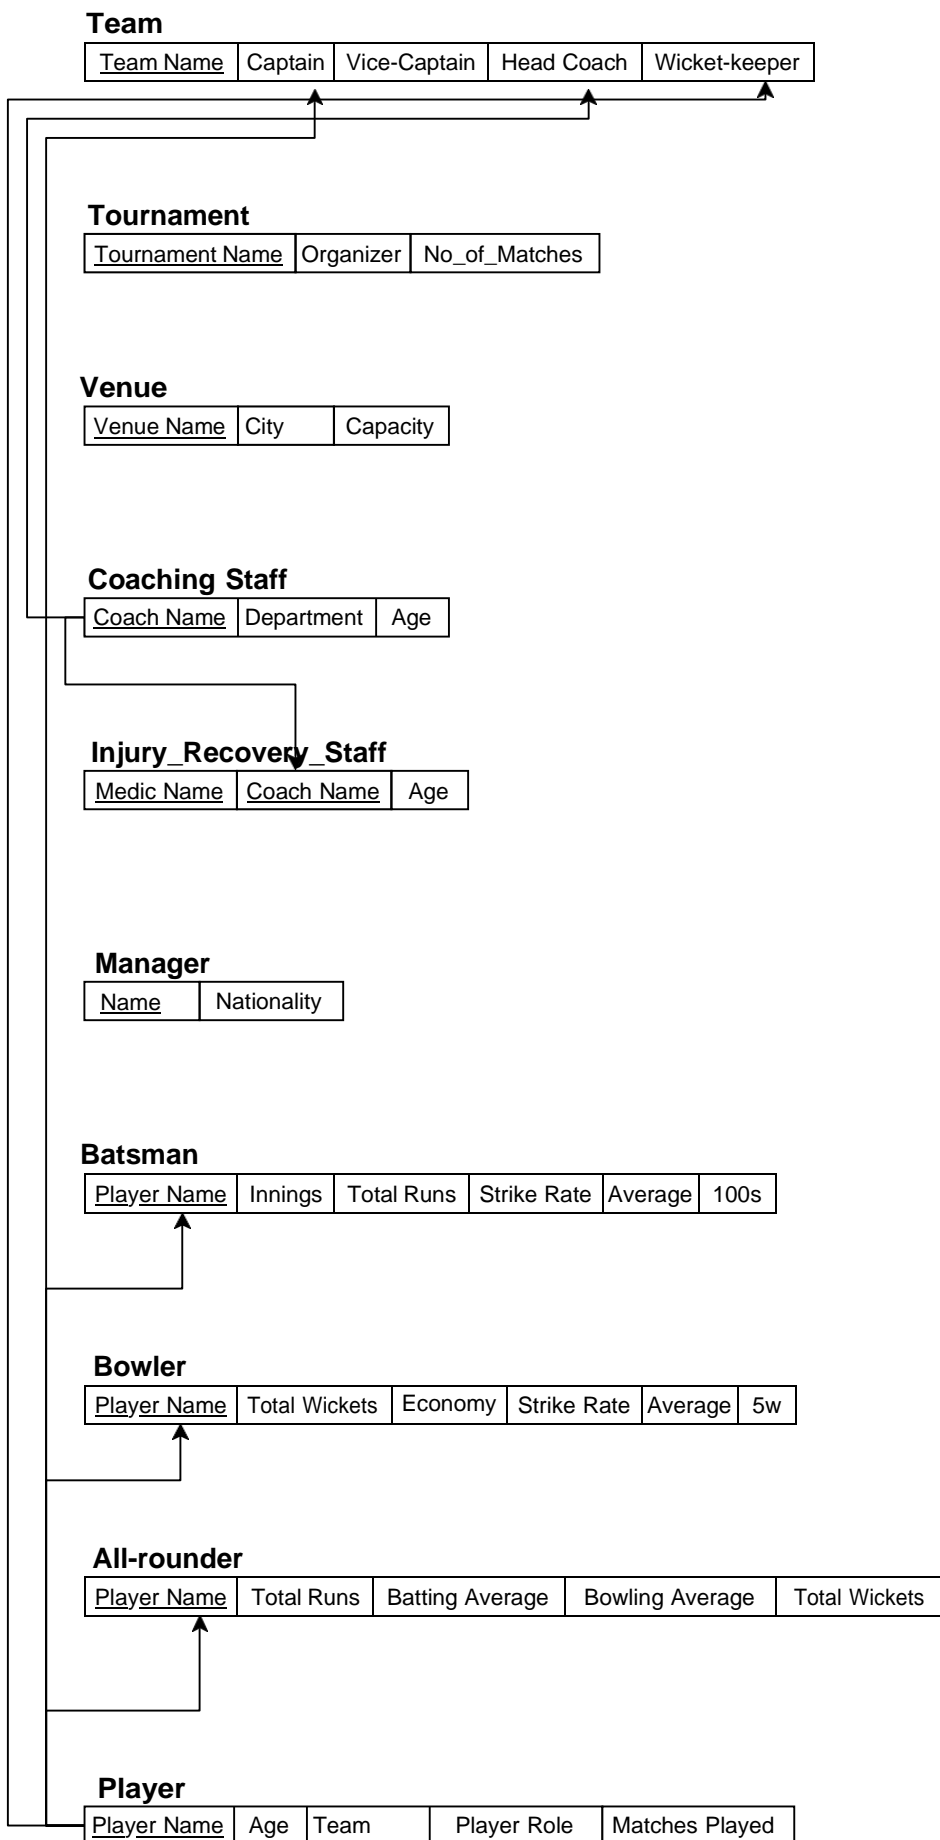

Boards and players can:

- Do everything media and public can do.
- Obtain a list of teams/players registered for a tournament.
- View and analyse the statistics of a certain player in a team.
- Select coaching staff and medical staff for a team.
- Get a list of all the captains, vice-captains and wicket keepers.

## EER Diagram (Conceptual Model)

## Global Conceptual Schema

The following code has been used to create the database Cricket\_Info -

```
create table Player(  
Player_Name varchar(20) not null primary key,  
Age int,  
Team varchar(20) not null,  
Role varchar(20) not null,  
Matches_Played int);  
insert into Player values ('Virat Kohli',32,'MI','Batsman',254);  
insert into Player values ('Rohit Sharma',33,'MI','Batsman',227);  
insert into Player values ('Shikhar Dhawan',35,'MI','Batsman',142);  
insert into Player values ('Shubman Gill',21,'MI','Batsman',3);  
insert into Player values ('Hardik Pandya',27,'MI','All-Rounder',60);  
insert into Player values ('Ravindra Jadeja',32,'MI','All-Rounder',168);  
insert into Player values ('KL Rahul',28,'MI','Batsman',38);  
insert into Player values ('Mohammed Shami',38,'CSK','Bowler',79);  
insert into Player values ('Jasprit Bumrah',27,'KKR','Bowler',67);  
insert into Player values ('Kuldeep Yadav',26,'RCB','Bowler',63);  
insert into Player values ('Yuzvendra Chahal',30,'PK','Bowler',54);  
insert into Player values ('Aaron Finch',34,'CSK','Batsman',132);  
insert into Player values ('Steven Smith',31,'CSK','Batsman',128);

# Normalization

## **Team**

*Attributes –*

- *Team\_Name*
- *Captain*
- *Vice\_Captain*
- *Head\_Coach*
- *Wicket\_Keeper*

*Functional Dependency –*

*Team\_Name -> Captain, Vice\_Captain, Head\_Coach, Wicket\_Keeper*

*Normalization –*

*The leftmost attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

**Team (Team\_Name, Captain, Vice\_Captain, Head\_Coach, Wicket\_Keeper)**

## **Tournament**

*Attributes –*

- *Tournament\_Name*
- *Organiser*
- *No\_of\_Matches*

*Functional Dependency –*

*Tournament\_Name-> Organiser,*

*No\_of\_Matches*

*Normalization -*

*The left most attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

***Tournament (Tournament Name, Organiser,  
No\_of\_Matches)***

## **Venue**

*Attributes –*

- *Venue\_Name*
- *City*
- *Capacity*

*Functional Dependency –*

*Venue\_Name -> Country, Capacity*

*Normalization*

*The left most attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

***Venue (Venue Name, City, Capacity)***

## **Coaching\_Staff**

*Attributes –*

- *Coach\_Name*
- *Department*
- *Age*

*Functional Dependency –*

*Coach\_Name -> Department, Age*

*Normalization –*

*The left most attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

***Coaching\_Staff (Coach\_Name, Department, Age)***

## ***Injury\_Recovery\_Staff***

*Attributes –*

- *Physiotherapist\_Name*
- *Coach\_Name*
- *Age*

*Functional Dependency –*

*Physiotherapist\_Name,*

*Coach\_Name -> Age* Normalization –

*Since there are no transitive dependencies, partial dependencies or a super key, the table is in 3NF form.*

***Injury\_Recovery\_Staff (Physiotherapist\_Name,  
Coach\_Name, Age)***

## ***Manager***

*Attributes –*

- *Name*
- *Nationality*

*Functional Dependency –*

*Name -> Nationality*

*Normalization –*

*The left most attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

***Manager (Name, Nationality)***

## **Batsman**

*Attributes –*

- *Player\_Name*
- *Innings*
- *Total\_Runs*
- *Strike\_Rate*
- *Average*
- *100s*

*Functional Dependency –*

*Player\_Name -> Innings, Total\_Runs, Strike\_Rate, Average, 100s*

*-Innings, Total\_Runs -> Player\_Name, Strike\_Rate, Average, 100s*

*Normalization –*

*There are no transitive dependencies or partial dependencies present. Since player name is determining each and every attribute of the entity it is the candidate key and the prime attribute also but other attributes all are not non-prime. Also, various other combinations of attributes can determine the other entities uniquely.*

*So, this table is in the 3NF form.*

***Batsman (Player\_Name, Innings, Total\_Runs, Strike\_Rate, Average, 100s)***

## **Bowler**

*Attributes –*

- *Player\_Name*
- *Total\_Wickets*
- *Economy*
- *Average*
- *5w*
- *Strike\_Rate*

*Functional Dependency –*

*Player\_Name -> Total\_Wickets, Economy, Average, 5w, Strike\_Rate*

*-Economy, Total\_Wickets -> Player\_Name, Strike\_Rate, Average, 5w*

*Normalization –*

*There are no transitive dependencies or partial dependencies present. Since player name is determining each and every attribute of the entity it is the candidate key and the prime attribute also but other attributes all are not non-prime. Also various other combinations of attributes can determine the other entities uniquely.*

*So this table is in the 3NF form.*

***Bowler (Player\_Name, Total\_Wickets, Economy, Average, 5w, Strike\_Rate)***

## ***All\_Rounder***

*Attributes –*

- *Player\_Name*
- *Total\_Runs*
- *Total\_Wickets*
- *Batting\_Average*
- *Bowling\_Average*

*Functional Dependency –*

*Player\_Name -> Total\_Wickets, Total\_Runs, Batting\_Average, Bowling\_Average*

*-Total\_Runs, Total\_Wickets -> Player\_Name, Batting\_Average, Bowling\_Average*

*Normalization –*

*There are no transitive dependencies or partial dependencies present. Since player name is determining each and every attribute of the entity it is the candidate key and the prime attribute also but other attributes all are not non-prime. Also various other combinations of attributes can determine the other entities uniquely.*

*So this table is in the 3NF form.*

***All\_Rounder (Player\_Name, Total\_Wickets, Total\_Runs,  
Batting\_Average, Bowling\_Average)***

## ***Player***

*Attributes –*

- *Player\_Name*
- *Age*
- *Team*
- *Player\_Role*
- *Matches\_Played*

*Functional Dependency –*

*Player\_Name -> Age, Team, Player\_Role, Matches\_Played*

*Normalization –*

*The left most attribute is the super key. There are no transitive dependencies or partial dependencies present.*

*So, this table is in the BCNF form.*

***Player (Player\_Name, Age, Team, Player\_Role, Matches\_Played)***

## Conclusion

The above designed database management system is capable of achieving all the required tasks as mentioned in the abstract of the project. The system hence proves to be very useful to collect and view the data in orderly manner as per the requirements of the user. This system caters to requirements of both media and fans as well as the cricket administration. It also helps to keep the track of all the data of the players as it updates the database after every match using triggers, view, stored procedures and stored functions. In this day and age when sports are so competitive, having this kind of a system can assist teams to properly formulate their strategies. It can help them in choosing the players required to play in particular game according to their statistics. This type of system can be used in various sports and leagues whenever necessary with some changes in it according to the requirements of the game.
